1.

Recommending items based on **global popularity** can (*check all that apply*):

2.

Recommending items using a **classification** approach can (*check all that apply*):

3.

Recommending items using a **simple count based co-occurrence matrix** can (*check all that apply*):

4.

Recommending items using **featurized matrix factorization** can (*check all that apply*):

5.

Normalizing co-occurrence matrices is used primarily to account for:

✓ 6.

A store has 3 customers and 3 products. Below are the learned feature vectors for each user and product. Based on this estimated model, which product would you recommend most highly to *User #2*?

User ID	Feature vector
1	(1.73, 0.01, 5.22)
2	(0.03, 4.41, 2.05)
3	(1.13, 0.89, 3.76)

Product ID	Feature vector
1	(3.29, 3.44, 3.67)
2	(0.82, 9.71, 3.88)
3	(8.34, 1.72, 0.02)

✓ 7.

For the liked and recommended items displayed below, calculate the **recall** and round to 2 decimal points. (As in the lesson, green squares indicate recommended items, magenta squares are liked items. Items not recommended are grayed out for clarity.) Note: enter your answer in American decimal format (e.g. enter 0.98, not 0,98)

✓ 8.

For the liked and recommended items displayed below, calculate the **precision** and round to 2 decimal points. (As in the lesson, green squares indicate recommended items, magenta squares are liked items. Items not recommended are grayed out for clarity.) Note: enter your answer in American decimal format (e.g. enter 0.98, not 0,98)

9.

Based on the precision-recall curves in the figure below, which recommender would you use?
